D	12/18/13	Rip Rap Calculations

Project Background / Purpose

Island Diversified, LLC is proposing to redevelop two adjacent parcels located at 15 Madbury Road and 8 Mathes Terrace in the Central Business District of Durham, New Hampshire. The proposal involves the removal of the existing buildings on site and the construction of a single multi-story building with commercial and residential occupancy as well as parking on the first floor of a portion of the building.

The two parcels that the site is comprised of are lots 12-5 & 12-6 located on Tax Map 2. These lots are located at the intersection of Madbury Road and Mathes Terrace, Lot 12-5 directly abuts Madbury Road and is 6,728 square feet (0.154 ac). Lot 12-6 is set back on Mathes Terrace and is 5,524 square feet (0.127 ac).

Soil Mapping

The soil mapping was determined by the NRCS USDA Strafford County Web Soil Survey. The soil found on site is Hollis Charlton, very rocky, fine sandy loam. This soil is a Hydrologic Soil Group C soil as modeled in the analysis. Refer to Appendix C for the NRCS Soil Map.

Drainage Analysis

Drainage conditions have been analyzed based on the runoff characteristics at two points of analysis (POA). This analysis utilizes HydroCAD modeling software. This program models the runoff based on the SCS TR-20 method and the time of concentration based on the SCS TR-55 method. This analysis compares the runoff rates for the 1 inch, 2, 10, 25, 50 and 100-year USDA/SCS Type III 24-hour storm events. The rainfall data used in the model is for the Town of Durham.

The two parcels identified as Lot 12-5 and Lot 12-6 total 0.154 and 0.127 acres, respectively. Each parcel has one building containing student housing. Also present are typical site amenities including parking areas, landscaping, and walkways. The Existing Conditions Plan depicts the existing development on the property.

Pre-Development Conditions

The enclosed Pre-Development Drainage Plan (Appendix A) depicts the contributing runoff areas that are generated from this property and from off-site areas that discharge stormwater runoff across this property. The watershed areas have been determined via inspection by our office as well as a topographical survey.

Pre-Development Drainage conditions have been analyzed based on the runoff characteristics at two points of analysis (POA). The back half of the property drains over Mathes Terrace to Pettee Brook to the south-west. The front half of the property drains toward Madbury Road. This runoff is collected in the Madbury Road closed drainage system or flows down Madbury Road. All runoff reaches Pettee Brook south of the parcel near the intersection with Pettee Brook Lane. From there Pettee Brook continues nearly a third of a mile to Beard's Creek. Beard's Creek continues for a half mile before reaching the Oyster River.

The cover types located on the lot are typical for the use and include pavement, woods, and grass, and landscape areas. The wooded, and grass areas are considered to be in good condition. The hydrologic analysis of the existing runoff conditions are provided in Appendix A.

Post-Development Conditions

The proposed site development is depicted on the Post Development Drainage Plan (Appendix B).

Subcatchment 1 of the Pre-Development has been divided into four subcatchments and Subcatchment 2 has been divided into three subcatchments in the Post-Development based on the proposed development of the site. The cover types are consistent with the Pre-Development.

The stormwater management design includes permeable pavers, a roof drain and gutter collection system, a drip strip, rain garden, and subsurface stormwater chamber system.

The permeable pavers provide stormwater treatment through filtration. The permeable paver system has underdrains with impermeable subgrade liners to maximize the capacity to store stormwater. The permeable pavers will be treating the runoff from the west side of the building. This runoff will then be routed through a manhole on its way to Pettee Brook. This design assumes a conservative infiltration rate through the pavement of 5 inches per hour after a 20-year period. It is expected that infiltration rates will exceed this estimate with implementation of a maintenance program which will include vacuum sweeping. The roof gutter system works as a means of collecting the roof runoff from the north side of the building and transporting it to the subsurface chamber system located within the parking garage. The rain garden will provide treatment by means of filtration through a subgrade which includes a soil filter bed and gravel. The rain garden will treat runoff that is from the east side of the building and portions of the north side of the building.

The hydrologic analysis of the proposed runoff conditions are provided in Appendix B.

Comparison of Pre- vs. Post-Conditions

The following table quantifies the peak rate of discharge and discharge volume leaving the parcel at POA 1 and 2 as shown on the Pre- and Post-Development Drainage Plans. The analysis has been run using the extreme rainfall quantities.

Table 1: Peak Rate of Runoff Comparison Table (cfs)

Condition	POA 1			POA 2		
	Pre	Post	Change	Pre	Post	Change
1 inch Storm	0.06	0.06	0.00	0.00	0.02	+0.02
2 Yr Storm	0.49	0.48	-0.01	0.15	0.11	-0.04
10 Yr Storm	0.80	0.78	-0.02	0.28	0.18	-0.10
25 Yr Storm	1.00	0.95	-0.05	0.36	0.21	-0.15
50 Yr Storm	1.13	1.06	-0.07	0.41	0.22	-0.19
100 Yr Storm	1.29	1.19	-0.10	0.48	0.24	-0.24

Table 2: Discharge Volume of Runoff Comparison Table (cubic feet)

Condition	POA 1			POA 2		
	Pre	Post	Change	Pre	Post	Change
1 inch storm	211	486	+275	35	93	+58
2 Yr Storm	1,526	2,112	+586	469	612	+143
10 Yr Storm	2,545	3,244	+699	855	1,002	+147
25 Yr Storm	3,200	3,957	+757	1,113	1,252	+139
50 Yr Storm	3,632	4,423	+791	1,285	1,417	+132
100 Yr Storm	4,179	5,011	+832	1,505	1,625	+120

There is a reduction or no change in the peak rate of runoff during all the design storm events at POA 1 and 2 except POA 2 in the 1-inch storm which is increased from 0.00 cfs to 0.02 cfs which is a negligible increase in runoff. The reduction in peak rate of discharge is attributed to the permeable pavers which in addition to treating runoff also provide peak flow attenuation. There is also flow attenuation provided by the subsurface chamber system and rain garden. The soils present on site are not conducive for infiltration best management practices and therefore discharge volume reduction is not possible on this site. Although infiltration is not expected or modeled in the analysis, minimal infiltration will occur below the rain garden.

Stormwater Treatment Practices

Stormwater treatment will be provided by permeable pavers, a rain garden, and a StormTech subsurface stormwater chamber system. The permeable pavers and rain garden filtrate stormwater through a subgrade consisting of stone and/or soil. The subsurface stormwater chamber system provides stormwater detention as well as cooling of roof runoff. The runoff going to the chamber system does not need to be previously treated due to the fact that it is comprised of only roof runoff. An oil hood (Snout) with a boom (Bioskirt) attached will be installed in a drain manhole that collects ancillary runoff from inside the parking garage. The Snout reduces pollutants such as floatables, trash, oil, and sediment. The Bio-skirt is used to reduce bacteria and allows for the absorption of oil and grease. A maintenance plan will be developed for the permanent erosion control structures and stormwater treatment systems.

Erosion & Sediment Control

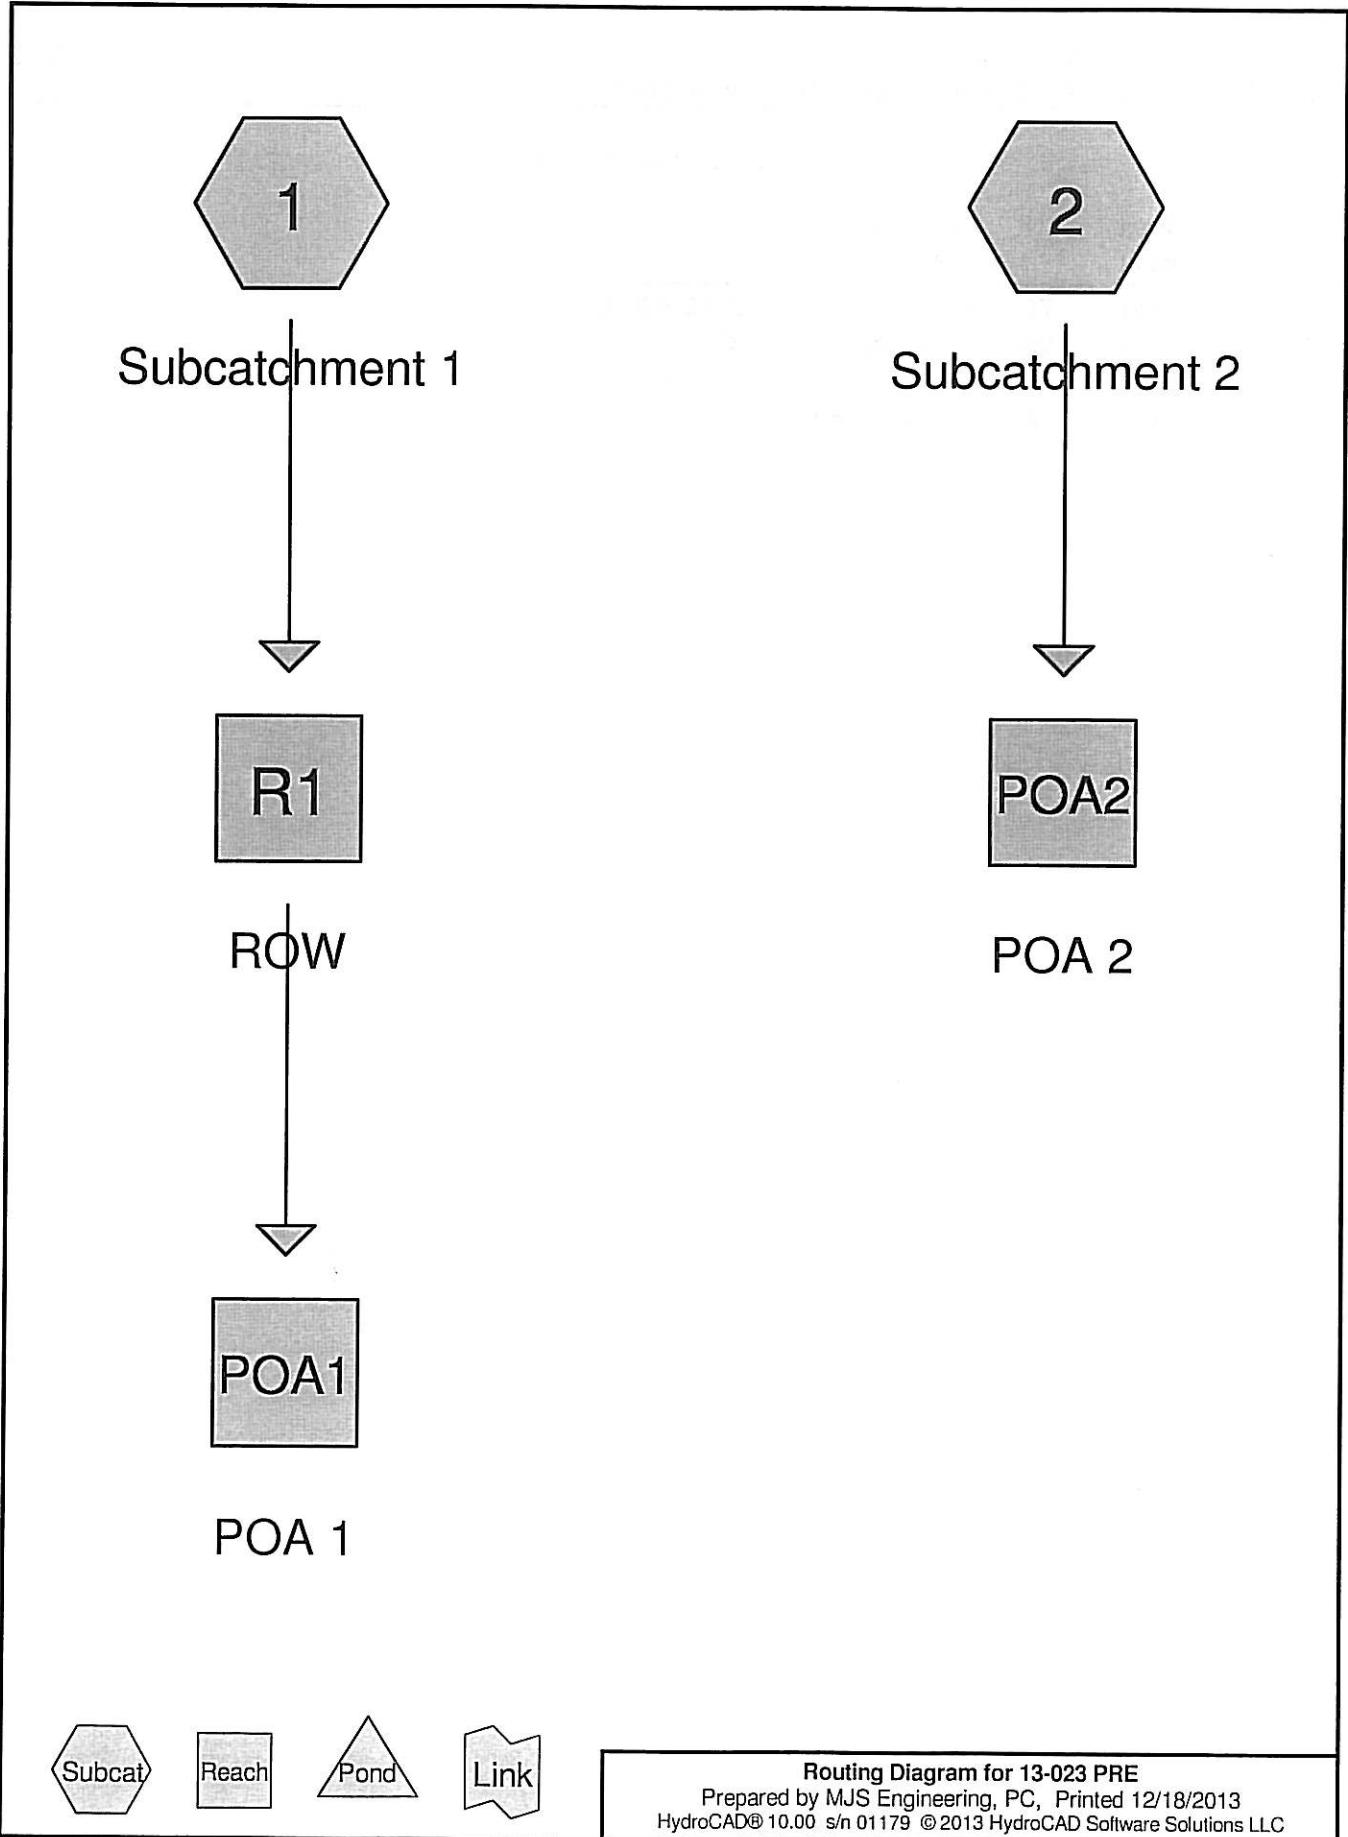

Temporary and permanent practices are used to prevent and minimize erosion and sedimentation on site. The installation of Silt Soxx™ at the perimeter of construction areas will provide sediment retention during the construction phase of the development. Geosynthetic Sediment Traps (Silt Sacks™) will be installed in all catchbasins accepting runoff from the redevelopment of the lot. Rip rap is proposed in drainage structure outlet areas to prevent erosion (see Appendix D for sizing calculations).

A stabilized construction entrance and daily sweeping of Madbury Road and Mathes Terrace will minimize the transport of sediment from the site. A maintenance plan will be developed for the permanent erosion control structures and stormwater treatment systems.

Conclusion

The enclosed comparative hydrologic model provides sufficient evidence that the proposed, permeable pavers, gutter system, rain garden, and subsurface chamber system will mitigate the typical increase in peak rate of discharge resulting from the increased impervious coverage. The use of erosion and sediment controls and proper construction practices will minimize the impact of this project.

d_{50} RIPRAP SIZING

PROJECT NAME :	Island Diversified LLC Durham, NH		
LOCATION:	Rip Rap #1		
BY :	MS	CHECKED BY :	MJS
DATE :	12/18/2013	STORM:	25-Yr
			DATE : 12/18/2013

DOWNSTREAM CHANNEL (OR SPREADER) HYDRAULICS

Peak Discharge Required =	0.65	cfs
Channel Bottom Width =	3.0	Feet
Hydraulic Gradient =	0.330	Feet/Feet
Left Side Slope =	20.0	:1(h:v)
Right Side Slope =	20.0	:1(h:v)
Depth of Flow* =	0.090	Feet
Manning's "n" =	0.0728	Please refer to Figure 7-52 of HANDBOOK
Area =	0.43	Square Feet
Wetted Perimeter =	6.60	Feet
Hydraulic Radius =	0.07	Feet
Top Width =	6.60	Feet
Velocity =	1.90	Feet/Second
Peak Discharge Determined =	0.82	cfs

La AND W CALCULATIONS:

Culvert Diameter (Do) =	10.0	Inches	Assumes Channel Bottom at the Culvert Equals the Invert Outlet Elevation of the Pipe. If this is not the case, the calculations involving the Tailwater will have to be calculated by hand.
Tail Water Depth (TW)* =	0.09	Feet	
Length of Apron (La) =	7	Feet	
Width of Apron @ D.S End (W) =	10	Feet	
Width of D.S. Apron if Channel (W) =	6.6	Feet	

*If outletting to Flat Area use TW depth = 0.2 x Do

ROCK RIPRAP SIZE

d_{50} =	0.15	Feet or	1.80	Inches	USE 4.0
$d_{50} = (0.02 \times Q^{4/3}) / (Tw \times Do)$					

ROCK RIPRAP GRADATION (TABLE 7-24 OF NHDES HANDBOOK)

% of Weight Smaller Than The Given Size	Size of Stone in Inches		
100	6.0	to	8.0
85	5.2	to	7.2
50	4.0	to	6.0
15	1.2	to	2.0

Minimum Rock Riprap Blanket Thickness = 12.0 Inches

Minimum Six inch Sand/Gravel Bedding or Geotextile Fabric Required Under All Rock Riprap

FORMULAS USED (Reference NHDES HANDBOOK, Pages 7-114, 7-115)

Manning's Uniform Channel Flow - $Q = (A \times 1.486 \times R^{(2/3)} \times S^{(1/2)}) / n$

Length of Apron (La) $Tw < Do/2$ - $La = (1.8 \times Q/Do^{1.5}) + 7 \times Do$

Length of Apron (La) $Tw \geq Do/2$ - $La = 3.0 \times Q/Do^{1.5} + 7 \times Do$

Width of Apron @ D.S End $Tw < Do/2$ - $W = 3 \times Do + La$

Width of Apron @ D.S End $Tw \geq Do/2$ - $W = 3 \times Do + 0.4 \times La$

Width of D.S. Apron if in Channel - Ch. BW + Sum of Side Slopes x Flow Depth

Width of Apron @ Culvert - $W_c = 3 \times Do$
